

Todd Conner

QA Engineer | Software Developer In Test | Open To Relocation

Midlothian, VA ✉ tconner2919@outlook.com ☎ 804-503-0022 | <https://github.com/vivaciousdove>

SUMMARY

Quality Assurance Engineer with experience validating complex, regulated systems and modern software platforms. Brings a systems-level engineering mindset to risk-focused testing across API, UI, and backend services. Known for modernizing manual testing into CI-integrated validation using Python-based automation and cloud platforms. A collaborative partner who translates requirements into targeted test coverage that improves release confidence.

SOFTWARE QUALITY ENGINEERING & AUTOMATION SKILLS

Automation & Test Engineering: Test Automation Design • Automation Framework Foundations • Playwright & Selenium (Foundational) • Python-Based API Automation • Postman Collections & Scripts • Page Object–Style Test Organization • Data-Driven Testing • Reusable Test Helpers & Utilities • Automation Debugging & Refactoring • CI-Integrated Test Execution

Quality Engineering Practices: Quality Strategy & Ownership • Risk-Based Testing • Release Readiness & Go/No-Go Assessment • Shift-Left Testing (Early API & Requirement Validation) • Functional & Regression Testing • User Acceptance Testing (UAT) • End-to-End Workflow Validation • Exploratory Testing • UI & UX Validation • Cross-Browser & Cross-Platform Testing (Web + Manual Mobile)

API & Backend Testing: REST API Testing • API Contract & Payload Validation • Schema & Field-Level Validation • Python (requests)–Based API Automation • Postman Collections & Test Scripts • JSON & XML Validation • Error Handling & Failure-Path Testing • Backend Data Integrity & Transaction Validation (SQL)

CI/CD, Cloud & DevOps: Cloud Platforms (AWS & GCP) • Infrastructure as Code (Terraform – Applied Projects) • Jenkins (Dockerized Pipelines) • GitHub (CLI & Workflow-Driven CI) • Docker Fundamentals • CI-Integrated Test Execution • Release Verification & Validation • Pipeline Troubleshooting & Observability • Environment Configuration & Consistency (Project-Level)

Programming & Scripting: Python (API Automation, Test Utilities) • SQL for Data Validation • JavaScript (Test Scripts & UI Validation) • HTML & CSS (DOM Inspection & UI Validation) • Bash and Shell scripting

Tools & Test Management: Jira (Defect Tracking & Workflow Management) • Git (CLI-Based Version Control) • Confluence (Requirements & Test Documentation) • Zephyr (Test Case Management & Execution) • TestRail (Working Familiarity) • VS Code & PyCharm (Primary Development IDEs) • IntelliJ (Working Familiarity)

Domain & Advanced Capabilities: Manual Mobile Testing (iOS & Android) • Analytics & Event Validation (API/UI-Level) • Authentication & Authorization Testing • Security-Aware Testing (Data Access, Roles, Failure Paths) • Failure-Scenario & Negative-Path Validation • Regulated & High-Trust Systems (Telecom & Enterprise Platforms) • AI-Assisted Testing (Test Ideation & Result Analysis)

PROFESSIONAL EXPERIENCE

Quality Assurance Software Engineer (Remote) | Diversociete | Atlanta, GA | 05/2025 – Present

Diversociete is a boutique e commerce company that designs and operates digital platforms enabling customers to discover curated products, place secure online orders, and receive a seamless shopping experience through integrated web and backend systems.

- Took end-to-end ownership of quality for assigned services, working closely with engineering and product teams from design through production to assess risk, align on test approach, and ensure releases were truly ready to ship.
- Built and expanded automated testing using JavaScript, Python, Selenium, and Postman to cover core e-commerce workflows like storefront setup, checkout, payments, and order management, across continuous feature delivery.
- Integrated automation directly into CI/CD pipelines with GitHub Actions and cloud runners, cutting release validation from roughly two days of manual effort to same-day approval for standard production releases.
- Led API and integration testing across catalog, inventory, pricing, payment, and fulfillment services by validating JSON payloads, business rules, and failure paths, catching defects before they surfaced in the UI or merchant experience.
- Used AI-assisted testing and result analysis to identify high-risk scenarios and recurring failure patterns, helping uncover issues earlier and reduce last-minute testing pressure late in the release cycle.
- Partner closely with developers and product leaders during refinement, triage, and fix validation to accelerate issue resolution, reducing reopenings and resolving most issues within the same sprint.
- Refactor regression testing strategy by focusing on the highest-traffic merchant and buyer journeys, shrinking full regression runs from multiple days to a focused one-day cycle without increasing post-release defects.
- E2E validation of responsive web and mobile applications covering functional, UI, API, integration, regression, performance, and data checks to ensure consistent behavior across browsers and devices for both merchant dashboards and customer storefronts.

Todd Conner

SQAE / Software Developer in Test / RFE | T-Mobile | Richmond, VA | 04/2015 – 04/2024

T-Mobile is a global technology and telecommunications company that designs, builds, and operates large scale web, mobile, and API driven platforms supporting customer applications, backend services, and data systems with a strong focus on performance, reliability, and scalability.

- Modernized high-risk, manual validation work by building automated workflows with Python, JavaScript, SQL, and API testing tools, cutting execution time from multiple hours to under an hour and allowing teams to focus on deeper, higher-value testing.
- Built robust API and backend validation coverage by testing REST and SOAP services for payload accuracy, business logic, and error handling, consistently intercepting integration defects before they get propagated to dependent systems.
- Took ownership of release quality by translating complex acceptance criteria into clear functional and regression scenarios, helping teams find defects earlier in the sprint and avoid late-stage release surprises.
- Created requirement-level test traceability by linking test artifacts directly to Jira user stories and traceability matrices, supporting auditability and reducing release risk in compliance-driven environments.
- Safeguarded data integrity across critical systems by executing targeted Oracle and MySQL queries to validate calculations, record creation, and updates, preventing reporting inaccuracies and customer facing data issues.
- Embedded quality into delivery pipelines by integrating automated tests with GitHub driven CI workflows, reducing manual regression effort by approximately two workdays per release enabling faster, more predictable deployments.
- Improved defect resolution flow by logging, tracking, and managing issues in Jira with clear reproduction steps, evidence, and severity context, increasing defect visibility and accelerating prioritization and fixes.
- Drove cross functional quality alignment by collaborating with offshore developers and product owners in hybrid Agile and Waterfall environments to align on quality expectations, streamline triage, and reduce repeat issues.
- Scaled quality impact through mentorship by guiding junior QA team members on test design, automation patterns, and defect documentation standards, shortening onboarding time and strengthening overall team effectiveness.

EDUCATION

Master of Business Administration, Western Governors University | Richmond, VA

Bachelor of Arts in Communications, Baylor University | Waco, TX
